Reference Range:

INDEX INTERPRETATION

<1.00 Negative

> or = 1.00 Positive

This test is intended to help identify individuals with antibodies to SARS-CoV-2 (COVID-19). The results of this semi-quantitative test should not be interpreted as an indication or degree of immunity or protection from reinfection.

A test result that is 1.00 or more (Positive) means an immune response to a COVID-19 spike vaccine or recent or prior infection with SARS-CoV-2. False positive results for the test may occur due to cross-reactivity from pre-existing antibodies or other possible causes.

A test result that is less than 1.00 (Negative) means that antibodies were not detected in the blood sample. This could mean that the patient has not been previously infected with SARS-CoV-2. False negative results for the test may occur if the patient's antibodies have not reached a sufficient level for the test to be able to detect them. Antibodies can take up to two to three weeks (sometimes longer) to develop after someone is infected or final vaccine dose is administered. How long antibodies to SARS-CoV-2 last after infection is not known.

This test should not be used to diagnose an active SARS-CoV-2 infection. If an active infection is suspected, direct molecular or antigen testing for SARS-CoV-2 is recommended.
