Patient Name: BARTON, DUSTIN

Patient ID: 20446

Exam Date: 24-May-2024 10:49:09 AM

Patient DOB: 30-May-1975

Accession: RAM129356

Referring Physician: BARTON, LINDSAY

Exam: MRI LT. ELBOW W/O

HISTORY: No surgery--injured working out--lt. posterior elbow pain x 4 months**COMPARISON:** None.**TECHNIQUE:** Routine MR of the left ankle was performed without contrast.

FINDINGS: Alignment is normal without evidence of fracture or contusion. Small interosseous ganglionic cysts are seen in the lateral humeral condyle. No joint effusion. The triceps tendon is intact. The biceps and brachialis tendons are intact. There is thickening of the common extensor tendon with increased intrasubstance signal at its origin on the humeral condyle. The attachment of the radial collateral ligament is not well visualized, though there are no secondary signs to suggest tear. The common extensor tendon and ulnar collateral ligament appear intact. Surrounding soft tissues are normal.

IMPRESSION:

1. Findings are consistent with lateral epicondylitis.
