Test Name	In Range	Out Of Range	Reference Range	Lab
MMR (IGG) PANEL (MEASLES, MUMPS, RUBELLA)				
MEASLES ANTIBODY (IGG)	>300.00		AU/mL	AT
AU/mL	Interpretation			
-----	-----			
<25.00	Negative			
25.00-29.99	Equivocal			
>29.99	Positive			

A positive result indicates that the patient has antibody to measles virus. It does not differentiate between an active or past infection. The clinical diagnosis must be interpreted in conjunction with clinical signs and symptoms of the patient.

MUMPS VIRUS				AT
ANTIBODY (IGG)	273.00		AU/mL	
AU/mL	Interpretation			
-----	-----			
<9.00	Negative			
9.00-10.99	Equivocal			
>10.99	Positive			

A positive result indicates that the patient has antibody to mumps virus. It does not differentiate between an active or past infection. The clinical diagnosis must be interpreted in conjunction with clinical signs and symptoms of the patient.

RUBELLA IMMUNE STATUS				AT

The presence of rubella IgG antibody suggests immunization or past or current infection with rubella virus.

HEPATITIS B SURFACE AB				AT
IMMUNITY, QN	<5 L	> OR = 10 mIU/mL

A positive result indicates that the patient has antibody to VZV but does not differentiate between an active or past infection. The clinical diagnosis must be interpreted in conjunction with the clinical signs and symptoms of the patient. This assay reliably measures immunity due to previous infection but may not be sensitive enough to detect antibodies induced by vaccination. Thus, a negative result in a vaccinated individual does not necessarily indicate susceptibility to VZV infection.
