VARICELLA ZOSTER VIRUS ANTIBODY (IGG)	L	<1.00	S/CO		F	AT

Signal to Cut-off

S/CO

Interpretation

<1.00

Negative - Antibody not detected

> or = 1.00

Positive - Antibody detected

A positive result indicates that the patient has antibody to VZV but does not differentiate between an active or past infection. The clinical diagnosis must be interpreted in conjunction with the clinical signs and symptoms of the patient. This assay reliably measures immunity due to previous infection but may not be sensitive enough to detect antibodies induced by vaccination. Thus, a negative result in a vaccinated individual does not necessarily indicate susceptibility to VZV infection. A more sensitive test for vaccination-induced immunity is Varicella Zoster Virus Antibody Immunity Screen, ACIF.
